## In the Claims:

Please add new Claims 9-12 as indicated below. The status of all claims is as follows:

## 1. (Original) A head slider comprising:

a slider body defining a medium-opposed surface hemisected into first and second areas by a centerline extending in a longitudinal direction of the slider body, wherein said second area is designed to generate a positive pressure larger than a positive pressure generated at the first area when a load acting on the slider body in a direction toward a recording medium decreases.

2. (Original) A recording medium drive comprising:

a recording medium;

- a head slider opposed to the recording medium at a front end of a head suspension;
- a load bar extending in a forward direction from the front end of the head suspension; and

a ramp member located outside the recording medium so as to define a slope along a path of movement of the load bar, wherein

said head slider includes a slider body defining a medium-opposed surface hemisected into first and second areas by a centerline extending in a longitudinal direction of the slider body, said second area being designed to generate a positive pressure larger than a

positive pressure generated at the first area when a load acting on the slider body in a direction toward the recording medium decreases.

## 3-8. (Canceled)

- 9. (New) The head slider according to claim 1, wherein a center of a distribution of the positive pressure moves on the slider body along an imaginary diagonal line from a center of a rectangular surface of the slider body according to a decrease of the load.
- 10. (New) The head slider according to claim 9, wherein a center of a distribution of a negative pressure moves on the slider body in a direction different from a direction of a movement of the positive pressure according to the decrease of the load, the negative pressure acting on the head slider in an opposite direction of the positive pressure.
- 11. (New) The recording medium drive according to claim 2, wherein a center of a distribution of the positive pressure moves on the slider body along an imaginary diagonal line from a center of a rectangular surface of the slider body according to a decrease of the load.

12. (New) The recording medium drive according to claim 11, wherein a center of a distribution of a negative pressure moves on the slider body in a direction different from a direction of a movement of the positive pressure according to the decrease of the load, the negative pressure acting on the head slider in an opposite direction of the positive pressure.
